

Places

a new approach to sightseeing and navigation

When Places starts it takes in account your available time and your position to guide you to a random sightseeing spot in walking distance. Places guides you by giving you vibration feedback when walking in the wrong direction. When you arrive you will get to see some facts about the spot you walked to.

With Places you can explore and get to know a city without having to look on your mobile all the time just by following the vibration feedback.

Here you can find some code of the key functionality of places. Calculating the distance and checking your position frequently.
